

Every checklist line, done and not done

Every line of the release-readiness list, with its current status and — where it is not finished — the actual reason. Statuses were re-derived from live production, the live database and the current build, not carried over from the earlier document.

REPORT DATE	1 August 2026
REVISION NOW	2b621ac – 22 commits past the checklist
CHECKLIST BASELINE	972dffa4 (31 July 2026)
TEST BASELINE	916 of 916 passing (was 830)
MIGRATIONS APPLIED SINCE	5
LAUNCH GATE	NOT MET

22 COMPLETE 9 moved today	13 PARTIAL real progress	45 OPEN 21 need you	80 LINES LISTED every one below
---	--	---	---

A note on the totals

This report enumerates **80** lines: the 65 numbered checks across P0 1 to P2 11, plus the 15 launch-gate and owner-input lines. The earlier document reported a total of 78 without stating which sections it counted, and its grouping cannot be reconstructed exactly — so rather than force a match, every line below is listed individually and the totals are simply what those lines add up to.

Not re-listed: the twelve "Additional Command Center hardening" and "insert-returning site" checks from the earlier document. All twelve were already complete and remain so.

Why an item is still open falls into five kinds, and the distinction matters more than the count:

Owner action — needs a person, an account, or a decision. No amount of engineering closes it.

Multi-week feature — genuinely unbuilt. Honest estimate, not a deferral.

Needs a harness — cannot be established by reading code; requires real devices or a browser runner.

Deliberately declined — considered and rejected, with the reasoning recorded.

Deferred on evidence — would be premature; the measurement that says so is given.

Of the 45 open lines: **21** need you — an account, a decision or a business input. **12** are genuinely unbuilt multi-week features. The remaining **12** depend on one of those two

finishing first.

P0 1 — Workspace data contract

STATUS	CHECK	EVIDENCE, OR WHY NOT
COMPLETE	Classify every plugin	Plugin catalogue, shown in workspace settings.
COMPLETE	Mark shared modules Company-wide	Scope badges visible in plugin settings.
PARTIAL	workspace_id on every workspace-private module	Core CRM, pipeline, underwriting, jobs, files, proposals and Tasks carry it. Why not done: an exhaustive per-plugin proof has never been produced — nobody has walked the full plugin list and demonstrated each one.
PARTIAL	Workspace checks in database policies	The hardened core is covered. Why not done: the plugin-by-plugin policy matrix is incomplete; this is the same gap as the line above, seen from the database side.
PARTIAL	Same scope for APIs, search, realtime, exports, backups	Cross-module search and tenant route links are scoped. Why not done: exports, backups and realtime channels have not been audited individually.
PARTIAL	Automated two-company / two-workspace isolation matrix	Moved from Open. An automated matrix now covers 66 tenant-scoped tables in CI, with a live rollback-only proof that a non-admin sees zero foreign rows. Why not complete: it is table-level, not the per-plugin matrix the line specifies.
OPEN	Manual two-identity test	Owner action. Requires two real signed-in identities — an owner and a restricted worker. Database-layer isolation is proven; interface-layer is assumed. Cannot be simulated.

P0 2 — SMS gating and rebuild

Two complete, six open. The gate itself is correct: SMS fails closed today, which is the safe state.

STATUS	CHECK	EVIDENCE, OR WHY NOT
COMPLETE	Hide SMS when readiness checks fail	Fails closed behind provider, schema, workspace, number and permission checks.
COMPLETE	Clear SMS setup state for admins	Explains unavailable setup rather than showing a loading failure.
OPEN	Workspace-scoped numbers and messages	Multi-week feature. The data model is intentionally not deployed. Rebuilding it means new tables, policies and inbound routing.
OPEN	Workspace membership in send/inbound APIs	Multi-week feature. Existing code is the old company-only model and cannot be enabled as-is.
OPEN	Inbound contacts in the destination workspace	Blocked on the workspace-safe inbound model above.
OPEN	Consent, STOP, unsubscribe, quiet hours	Multi-week feature, and partly a compliance question — the required policy text is an owner input.

STATUS	CHECK	EVIDENCE, OR WHY NOT
OPEN	Provider IDs, delivery events, retries, usage	Multi-week feature. Not started.
OPEN	Controlled send / reply / failure-path tests	Owner action + feature. Needs the provider account and number configured before any test is meaningful.

P0 3 — Contact → quote → job handoffs

STATUS	CHECK	EVIDENCE, OR WHY NOT
COMPLETE	One database operation for conversion	Workspace-authorised atomic RPC.
COMPLETE	Idempotent Graduate to quote	Request UUID stops repeated clicks creating duplicates.
COMPLETE	Separate Create another quote	A deliberate second quote gets a new request id.
COMPLETE	Validate account / contact / site / workspace	The RPC validates and locks linked records before converting.
PARTIAL	Quote-to-job idempotency plus completeness checks	Idempotency holds. Why not done: the explicit completeness review has not been signed off by a person.
COMPLETE	Review screen for duplicates and missing links	Moved from Open. Admin-gated Settings tab, lazily loaded, reporting duplicates and incomplete links with a direct link to each record.
OPEN	Repair existing records after human review	Owner action, by design. The screen deliberately has no bulk-fix button: a mass rewrite of pilot data cannot be undone and the right answer differs per record. Someone has to work the list.

P0 4 — Account and access loop

One complete, seven open — and every open line here is an owner action. This is the densest cluster of things engineering cannot close.

STATUS	CHECK	EVIDENCE, OR WHY NOT
COMPLETE	Redirect stale company URLs	Tenant-route resolver picks an allowed company and workspace before render.
OPEN	Enable leaked-password protection	Owner action. Confirmed still disabled on 1 August. A single Supabase dashboard toggle; requires account-owner access. This is the cheapest open item on the entire list.
OPEN	Branded verification and recovery email	Owner action. Sender domain, SMTP and templates need configuring, then delivery confirmed to a real inbox.
OPEN	Send and accept one real invitation	Owner action. Invite code, ledger, retry and copy-link fallback are live. What is missing is a second real mailbox to receive one.
OPEN	Prove the worker sees only assigned workspaces	Owner action. Rollback-only database checks pass. Browser verification with a genuinely separate identity has not happened.

STATUS	CHECK	EVIDENCE, OR WHY NOT
OPEN	Remove, reactivate, reassign the worker	Owner action. Depends on the two-identity rehearsal existing first.
OPEN	Support report reaches inbox and ledger	Owner action. Dialog and function are live; no team-owned monitored inbox has been named, so there is nowhere to confirm delivery.
OPEN	Verify embedded Tasks as a restricted worker	Owner action. Tasks loads for the test account; the restricted-worker case needs the second identity.

P0 5 — Eager loading and production visibility

STATUS	CHECK	EVIDENCE, OR WHY NOT
PARTIAL	Load only identity and navigation at startup	First paint went from 51 tables to 34 ; eight domains now load on demand. Why not complete: 34 is not "identity, tenants, workspaces and navigation" — messages, notifications and files stay eager on purpose, because the topbar shows unread counts on first paint and a wrong badge is worse than a query.
PARTIAL	Fetch each module when its route opens	19 lazy chunks; EOD, master panel, handoff review, company search, reporting and the builder merge all load on demand. Why not complete: not every module follows the boundary — the App Builder editing UI is the largest exception.
OPEN	Server-side pagination for high-volume tables	Deferred on evidence. The largest table in production holds 338 rows; jobs and contacts are in single digits. Pagination would add complexity to every list screen to solve a problem that does not exist yet. Worth doing when a customer's data makes it real.
PARTIAL	Split the main bundle	PDF.js and Leaflet are lazy. Why not complete: measured three further extractions. The 50 self-contained builder helpers cannot help — they are called from startup paths, so they stay a static import and buy nothing. The modal stack's transitive closure is 1,512 declarations / 1.46 MB because it calls <code>render()</code> , so extracting it needs 66 injected dependencies. That is a real refactor, scoped but not attempted blind.
OPEN	Realistic-data performance budgets	Needs a harness and realistic data. Bundle budget exists; query and route budgets against customer-sized data do not.
COMPLETE	Browser error reporting with tenant and revision	Moved from Open. Live and verified end to end, including that a probe carrying <code>?token=...</code> was logged with the query stripped.
OPEN	Launch dashboard for client / API / email health	Needs a product decision. What it should surface, and what counts as unhealthy, is not an engineering call. Client-side error capture now feeds it when it exists.

P1 6 — Labels, segments, campaigns

STATUS	CHECK	EVIDENCE, OR WHY NOT
COMPLETE	Contact labels and many-to-many assignments	Moved from Open, today. Two tables scoped exactly like <code>contacts</code> . Assignment policies verify the contact's <i>and</i> the label's workspace, not just the row's own column. Proved as a real member and rolled back: cross-workspace assignment rejected, foreign-workspace label rejected, case-duplicate rejected.
OPEN	Saved segments with workspace-aware filters	Multi-week feature. Depends on the labels model, which now exists — this is the natural next slice.
OPEN	Campaigns and memberships	Multi-week feature. Not started.
OPEN	Templates, consent, scheduling, delivery, unsubscribe	Multi-week feature, and consent wording is an owner input.
OPEN	Campaign reporting from delivery events	Depends on delivery existing first.
OPEN	Stop overwriting lead source / labels in notes	Now unblocked. It was blocked on the durable model, which landed today. The remaining work is changing the campaign action to write assignments instead of mutating <code>lead_source</code> and <code>notes</code> .

P1 7 — Durable, auditable automations

All five open. Nothing here has been started; the honest position is that this is a subsystem, not a set of fixes.

STATUS	CHECK	EVIDENCE, OR WHY NOT
OPEN	Server-side event or outbox	Multi-week feature. Rules still fire from browser action paths, which means an automation only runs if the person who triggered it had the app open.
OPEN	Idempotency, retries, dead-letter, timeouts	Multi-week feature. Depends on the outbox above.
OPEN	Durable run ledger with readable errors	Multi-week feature. Buildable as a slice, but a ledger written from the browser records only what the browser did — of limited value before triggering moves server-side.
OPEN	Test rule, Run once, Pause, View runs	Depends on the run ledger.
OPEN	Imports trigger the same rules as edits	Cannot be proven while triggering is browser-side; an import that bypasses the browser bypasses the rules.

P1 8 — App Builder collaboration safety

STATUS	CHECK	EVIDENCE, OR WHY NOT
COMPLETE	Version checks and conflict handling before saves	Moved from Open. Saves are conditional on the revision they were based on; a stale save merges instead of overwriting. Proved live and rolled back.

STATUS	CHECK	EVIDENCE, OR WHY NOT
OPEN	Normalize apps, fields, views, records	Multi-week feature. The document is still one JSONB row per company. The save conflict is solved; the storage model underneath is unchanged.
OPEN	Draft, published and rollback versions	Multi-week feature. Depends on normalisation.
OPEN	Rename the builder's internal workspace concept	Needs your decision. <code>doc.workspaces</code> is a <i>persisted</i> JSONB key in every company's document. Renaming means migrating live data and carrying backward compatibility, for a terminology fix. Not a call to make unilaterally.

P1 9 — Identity and usability

STATUS	CHECK	EVIDENCE, OR WHY NOT
COMPLETE	Remaining Quest HQ branding	Moved from Open. Zero occurrences across shell, PWA manifest, embedded Tasks and legacy redirect stubs. Smoke markers accept both brands so the check is not brand-locked.
COMPLETE	Job-type filter reduced to configured values plus search	Searchable combobox.
PARTIAL	Clipped tables and panels at laptop widths	Targeted fixes landed. Why not complete: a full viewport matrix needs a browser harness, not source reading.
COMPLETE	Accessible names and keyboard / focus behaviour	Moved from Partial. Focus now moves into a modal on open and returns to the opening control on close — it previously fell to the document body, so a screen reader never announced the dialog. All icon-only controls named; both modal shells announced as dialogs; six colours raised to WCAG AA including two on the public landing page.
PARTIAL	Phone and tablet viewport review	Needs a harness. Layout across real widths cannot be established by static analysis. Requires devices or an automated browser runner, neither of which exists here.

P2 10 — Database and runtime cleanup

STATUS	CHECK	EVIDENCE, OR WHY NOT
COMPLETE	Missing foreign-key indexes	Moved from Partial. Every foreign key is covered. One nearly escaped: <code>create index if not exists</code> matches on the index <i>name</i> , and one already existed under the intended name on a composite that did not cover the key.
COMPLETE	Repeated row-level policy evaluation	Moved from Partial. 17 policies re-evaluated <code>auth.uid()</code> per row; now hoisted. Advisor family at zero. The 15 remaining multiple-permissive findings are deliberately declined — merging them trades a minor planner gain for compound expressions where a tenancy mistake could hide.
COMPLETE	RingCentral <code>url.parse()</code> deprecation	WHATWG URL API throughout.
COMPLETE	Document server-only tables	Moved from Partial. Full inventory from live state: 77 tables, 75 browser-reachable, 2 server-only, none with RLS off.

P2 11 — Repository and architecture

STATUS	CHECK	EVIDENCE, OR WHY NOT
PARTIAL	Confirm and archive stale remote branches	Moved from Open. Needs your decision. Both audited and recorded; nothing deleted. <code>quest-hq-command-center-for-deployment</code> carries 3 commits and +7,784 lines — deleting it is not mine to do.
PARTIAL	Continue splitting the main module	34 modules extracted. Why not complete: <code>src/main.js</code> is 40,877 lines and has <i>grown</i> , because features were added to it faster than slices were removed.
PARTIAL	Continue splitting the stylesheet	<code>src/styles.css</code> is 27,970 lines. Why not done: no deduplication pass has been attempted; the file has only grown.
COMPLETE	Keep smoke tests and the baseline green	916 of 916 passing, build, bundle budget, boot check and 36/36 production routes.

Launch gate and owner inputs

All fifteen of these are owner-side. None is waiting on code.

STATUS	CHECK	WHY IT IS STILL OPEN
OPEN	Every P0 has evidence and sign-off	Several P0 items above remain open, and no accountable owner has signed anything off.
OPEN	Two identities pass full isolation	The rehearsal has not been run. Database evidence exists; interface evidence does not.
OPEN	Auth mail, invite, support, recovery reach inboxes	No monitored mailbox has been named to receive them.
COMPLETE	SMS compliant or completely gated	Completely gated and failing closed — the correct posture.
OPEN	No unresolved CRM handoff in pilot data	The review screen exists; the human pass through it has not happened.
OPEN	Monitoring covers browser, API, email, slow routes	Browser errors are now captured. The consolidated view does not exist and needs a product decision on what it shows.
OPEN	Pricing, payments, banking, refunds, legal, support	Business inputs. Outside engineering entirely.
OPEN	Rollback candidate and launch-day operator named	A deployable previous revision exists; the accountable people are not recorded anywhere.
OPEN	Bank and payment provider	Owner input.
OPEN	Pricing and included limits	Owner input.
OPEN	Refund and cancellation rules	Owner input.
OPEN	Legal text	Owner input; needs legal review, not engineering.
OPEN	Public billing and support contacts	Owner input.

STATUS	CHECK	WHY IT IS STILL OPEN
OPEN	Email and Auth delivery	Owner input; sender domain and SMTP need configuring before anything can be proven.
OPEN	Launch-day ownership	Owner input.

Also fixed, and not on any checklist

Four items found by reading code rather than working a list. Two were security holes.

Three messaging policies enforced nothing

They compared a column to itself — `mc.company_id = mc.company_id` — which is always true. The intent was to tie a new row to its parent, so a client could insert a message tagged with one company's id into another company's conversation. Zero existing rows violated the intent, so tightening closed a hole rather than invalidating data.

A trigger function was callable by anonymous users

`touch_eod_report_updated_at()` kept PostgreSQL's default EXECUTE grant to PUBLIC, which PostgREST exposes as an endpoint. Introduced by my own EOD migration. Five sibling functions were already correct; a test now derives every trigger function from the migration history and fails if one ships unrevoked.

The tenancy guard was three tables out of date

It reads a snapshot captured on 29 July, so it reported "63 tenant-scoped tables all have RLS" while the database held 66. Every table added since — `eod_reports` included — sat outside its coverage while the check reported success. A check whose coverage silently shrinks is worse than no check, because the number it prints is reassuring.

Linked apps were treated as absent by the interface

Installing an app into a second workspace worked at the data level, but three places filtered on "not linked" — most visibly, a workspace whose only app came from elsewhere got no app tile at all, making a working feature look broken.

What to do next

Ordered by what unblocks the most for the least effort.

1 — Enable leaked-password protection

One dashboard setting. The only open item on the entire list that closes with a single action and no dependency.

2 — Create the four crew accounts

Alkeith, Jesus, Manny, Mackenzie. `eod_reports` holds zero rows: the app built for them has never been opened by any of them, so there is still no evidence it meets their needs. This has been the longest-standing blocker.

3 — Run the two-identity rehearsal with a real second mailbox

Closes six open lines at once across P0 1 and P0 4, and needs the invitation path working, so it pairs naturally with the email configuration.

4 — Decide the two items waiting on you

Whether to migrate the persisted builder key for the rename, and what happens to the deployment branch. Both are small once decided and neither is mine to decide.
