

How Questbase Works

Questbase is a multi-tenant operating system for roofing and service companies — the place a lead becomes a quote, a quote becomes a job, and the job gets finished, filed and paid for.

21 modules 2 levels of tenancy Live at questbase.io

01

The one-sentence version

Most contractors run on a pile of disconnected tools. Questbase replaces the pile.

A roofing or service company typically keeps customers in one system, estimates in a spreadsheet, job photos on someone's phone, crew hours on paper, and invoices somewhere else again. Nothing knows about anything else, so the same address gets typed in five times and nobody can answer "what's the status of the Henderson job?" without asking three people.

Questbase holds all of it in one account: the customer record, the estimate, the job, the photos, the forms, the crew's hours, the approvals and the money — with each piece linked to the others, so the answer to that question is on one screen.

02

How an account is organised

Two levels: the company, and the workspaces inside it.

This is the part worth understanding first, because everything else hangs off it.

A **company** is the customer account — the thing that gets billed, and the outer security boundary. One roofing business, one company.

A **workspace** is a configurable environment inside that company. Different teams, branches or pipelines can each have their own workspace, with their own apps, pipeline stages, roles and records — without anyone having to buy a second account. A residential crew and a commercial crew can work completely differently under one roof.

EXAMPLE STRUCTURE

Henderson Roofing & Exteriors

The company — billing, subscription, and the outer security boundary. People are members here.

Residential

Retail re-roofs and repairs.

Contacts Quotes

Jobs Estimator

Client Portals

Commercial

Bid work, longer cycles, different stages.

Contacts Proposals

Jobs Finance

Service & Maintenance

Callouts and recurring work.

Contacts Jobs Forms

Clock

WHY IT MATTERS

Turning a module off preserves its data — it hides the tool, it doesn't delete the records. That means a workspace can be reshaped as the business changes without losing history.

03

The words Questbase uses

These terms appear throughout the app and mean specific things.

TERM	WHAT IT MEANS
Contact	A person or prospect — the homeowner, the property manager, the lead who called.
Account	The company or household those contacts belong to.
Site	The physical property where the work happens. Separate from the contact, because the person who pays is not always at the address.
Quote (Deal)	A sales opportunity. It can be converted into a job when it's won.
Job	The container for the actual work: schedule, crew, photos, documents, change orders, costs.
Task	A unit of work to be done. Tasks also supply the shared "what's next" shown on the contact, quote or job they're linked to.
Workspace	A configurable environment inside one company, with its own apps, stages and roles.
Module	A tool switched on for a workspace — Jobs, Finance, Forms and so on.

04

A day in the system

The work moves through five stages, and the record travels with it.

This is the sequence the product is built around. Each stage hands its work to the next one rather than starting over.

1

A lead arrives

Someone calls, fills in a public form on the website, or gets added by hand. They become a **contact**, attached to a **site** — the property. The contact moves through live pipeline stages as they're qualified.

Contacts · Forms · Inbox

2

You price the work

The estimator works out the measurements and the cost, pulling vendor pricing from the price book. That becomes a **quote**, and a proposal can be sent to the customer to read and accept online.

Estimator · Price Book · Quotes · Proposals

3

The quote is won and becomes a job

Converting carries the contact, site and pricing across — nothing is retyped. The **job** now holds the schedule, the crew, the documents and the photos, and moves through its own production stages.

Jobs · Calendar · Files

4

The crew does the work

Tasks say what's next. Crews clock in and out, photos and site forms go straight onto the job record, and anything needing sign-off goes to approvals. The customer can follow progress in a client portal.

Tasks · Workday · Clock · Time · Approvals · Client Portals

5

It gets closed out and paid

Costs, change orders and invoicing sit in finance, against the same job. Reports read across all of it — what's in the pipeline, what's in production, what it cost, who did it.

Finance · Reports · Team Workload

05

What's in the box

Twenty-one modules, grouped the way the app groups them.

Not every workspace uses every one — that's the point of switching them on per workspace.

DAILY WORK

Home

Your dashboard and what needs attention.

Workday

The day's work in one view.

Tasks

Work items, linked to jobs, quotes and contacts.

Messages

Internal conversations and the inbox.

Calendar

Scheduling and meetings.

SALES PIPELINE

Contacts

The CRM, with live stages.

Quotes

Opportunities that convert into jobs.

Estimator

Takeoffs and pricing decisions.

Proposals

Customer-facing documents they can accept online.

Price Book

Vendor cost catalogue behind the estimates.

PRODUCTION

Jobs

The work container, with its own stages.

Files

Photos and documents, tied to records.

Forms

Site forms and public intake forms.

Approvals

Anything needing a sign-off.

PEOPLE & TIME

Clock

Crew clock in and out.

Time

Hours and timesheets.

Team Chart

Who reports to whom.

People & Access

Members, roles, invitations.

MONEY & INSIGHT

Finance

Costs, change orders, invoicing.

Reports

Analytics across pipeline and production.

OUTSIDE & CUSTOM

Client Portals

What the customer sees.

Workspaces

The App Builder — build your own tools.

Setup

Company profile, workspaces, pipelines, integrations.

06

Build your own tools

The App Builder is the part that isn't fixed.

Not every company works the same way, so Questbase includes a no-code **App Builder** inside each workspace. You define your own record type — fields, list

views, pipeline stages, calculations, automations — without a developer.

A finished app can be shared to the **Quest App Market** and installed into another workspace, which is how a working setup gets reused rather than rebuilt. Ready-made sample apps cover common needs across CRM, school and retail scenarios.

There's also a guided setup: answer a short questionnaire about the kind of work a workspace does, or pick a ready-made blueprint, and Questbase proposes a plan of apps, pipeline stages and roles. The owner reviews and edits that plan before anything is created — it never rewrites a neighbouring workspace.

07

Who can see what

Access is decided in layers, and the database enforces the last one.

Owners, admins and developers reach every active workspace in their company. Regular workers don't — they're assigned to specific workspaces, and **can hold a different role in each one**. Someone can be a manager in Service and an ordinary member in Commercial.

On top of that sit roles, individual permissions, per-record access and per-field permissions. Underneath all of it, the database itself enforces the company boundary, so a permission mistake in the interface still can't hand one company another company's records.

People outside the company

Customers never get an account. Client portals, online proposals and public forms are served through narrowly scoped links that expose exactly one thing — not a login with broad access.

The public demo is bundled sample data and is permanently read-only.

08

What isn't there yet

Worth stating plainly in any report.

UNAVAILABLE

Outbound SMS

Deliberately switched off and fails closed. Turning it on needs a chosen provider plus proper number, routing and delivery handling — a coordinated release, not a setting.

OWNER DECISION

Payments and billing

The subscription machinery exists; the provider, prices, refund rules and legal text are still commercial decisions to be made.

BEFORE LAUNCH

Email delivery proving

Invitations and notifications are built and working in code. Sending real mail to a real inbox still needs one controlled test against a team mailbox.

BEHIND A FLAG

Native Tasks

A host-built task surface exists but is off by default. The established task engine remains the live one.

PLANNED

Tickets and Templates

Mapped out as future areas rather than shipped tools.

09

Where it runs

Questbase is a web application — nothing to install, and it installs to an Android home screen as a progressive web app if someone wants it there. It runs at **questbase.io**, with the database, files and access rules hosted on managed infrastructure.

Every deployment is verified against the live site before it's considered done: the application shell, all twenty-one module routes per company, and the exact build that's serving. A scheduled watchdog re-runs that check every six hours and raises an incident automatically if production drifts.

NAMING NOTE

The product is **Questbase**. Some internal identifiers still carry the older *Quest HQ Command Center* name from before the rename — the same system, mid-transition.
