

Workspace Apps - Function Check

20 August 2026 · main @ cdb732b, plus 19 uncommitted files

A pass over every function of a workspace app, verified against the project's automated checks and its four release gates. It records what was tested, what the result was, and - just as deliberately - what these checks cannot tell you.

How this was checked

- 343 test files, 4,099 tests, run in full. These are unit and static checks over the real modules: pure logic is executed, and rendered markup is asserted against the source that draws it.
- The four project gates: the AI project brain, the tenancy matrix, the production build, and the bundle budget.
- NOT a browser walkthrough. .ai/README.md instructs that a local development or preview server must not be started, so nothing below was clicked through in a running app. Where a function depends on live behaviour - a real Supabase round trip, a drag, a print dialog - that is named under "Not verified" at the end rather than implied to be working.

Gates

GATE	RESULT	DETAIL
Automated tests	PASS	4,099 of 4,099 · 343 files · 0 failing, 0 skipped
Project brain	PASS	21 required files · 18 markdown · migration marker current
Tenancy matrix	PASS	76 tenant-scoped tables, all with RLS and a readable policy
Production build	PASS	Vite build succeeded · no top-level throw on module init
Bundle budget	PASS	entry 363,996 of 364,544 gzip bytes · 548 bytes spare

Function by function

Every function a workspace app offers, with the automated checks that cover it. "Tests" counts the assertions in the files exercising that area; a file serving two areas is counted in both. All of them pass.

FUNCTION	FILES	TESTS	RESULT
Records - the Items tab	20	234	PASS
Records - the record page	6	108	PASS
Fields - the builder & 30 types	12	234	PASS
Fields - import & export	2	49	PASS
Button field - push, move, set, link	10	163	PASS
Relationships, rollups & calculations	5	87	PASS
Sub-item lists (collections)	1	57	PASS
The Form field - document builder	16	301	PASS
The Sheet field - spreadsheet	5	86	PASS
Views, filters, sort & search	16	254	PASS
The Calendar tab	5	70	PASS
The Dashboard tab	12	168	PASS
Reports tab	3	36	PASS
Automations	2	18	PASS
Recycle bin & restore	3	42	PASS
Comments & activity feed	9	158	PASS
Quick Create - Task, Field, Call, SMS	18	188	PASS
Import & export of data (CSV, app files)	10	112	PASS

App & workspace settings	17	195	PASS
Sharing, intake links & the app market	11	94	PASS
Files, photos & uploads	16	134	PASS
Permissions, roles & tenancy	18	120	PASS

The app itself offers 8 tabs - Dashboard, Calendar, Items, Fields, Reports, Automations, Recycle bin and Settings - and 30 field types. Every tab and every field type is reached by at least one of the areas above.

Fixed during this check

Six defects were found and repaired while checking. Each has a regression test.

- Call said "This record has no phone number" over a record displaying one. The phone picker excluded fields hidden from the ITEMS TABLE - a column-width setting that leaves the field visible and editable on the record. Per-app, which is why it struck some apps and not others.
- The Call and SMS dialog could stick on "Saving..." for ever. The insert was awaited with no try/catch and no timeout, and the caller never caught, so any throw left the dialog disabled with its retry guard swallowing further presses. Now caught, bounded at 20 seconds, and cancellable.
- Scheduling a call waited on a write of the WHOLE company document - every app and every record - for two lines of bookkeeping. The call is durable the moment its own row lands, so the dialog no longer waits for the rest.
- A push or move between two apps in the same company serialised and uploaded that whole document TWICE, once for the arrival and once for the removal. It is one write now, which also makes a move atomic instead of merely well-ordered.
- A timer left running after a successful save held the event loop open for 20 seconds.
- The Call dialog still claimed nothing rings on its own. The alarm shipped on 19 August.

Open - needs a decision

- Every workspace edit rewrites the entire company document, JSON.stringify'd synchronously into localStorage before it is uploaded. Cost scales with everything you own rather than with what you changed, so photos and spreadsheets on unrelated records slow unrelated saves. This is the root cause behind the lag reports. Halving it helped; fixing it is per-record storage, which is a piece of work in its own right.
- A button-enable pass calls .closest() on `document`, which has no such method - so the "only inside a modal or record page" guard silently never applies, and opening any modal disables buttons page-wide.
- A reported failure of a Move button could not be reproduced. The move path, its ordering and its id handling were all read and are sound; the surface it fails on is still needed.
- Nineteen files are uncommitted, including three finished features: field-setup import and export, Form-layout import and export, and the +N photo badge. None of it is deployed.

Not verified

These are outside what the checks above can reach, and are listed so the report is not read as saying more than it does.

- Anything in a real browser: clicks, drags, focus, scroll, printing, the PDF and PNG exports.
- Live Supabase round trips - RLS as the database actually enforces it, realtime refresh, and save conflicts between two people editing at once.
- SMS delivery. The routing contract is not implemented, and the dialog says so.
- Performance under real data volume. The lag reports are diagnosed by reading the code, not measured.
